

## Anatomy for Dentistry

Dr. Mohammad Alsalem, PhD

## Functions of Reticular formation

- **Control of skeletal muscle.**
  - reticulospinal tract
  - maintaining the tone of the antigravity muscles (assisted by the vestibular apparatus)
  - facial expression associated with emotion
- **Control of somatic and visceral sensations.**
- **Control of pain perception (Gate mechanism)**

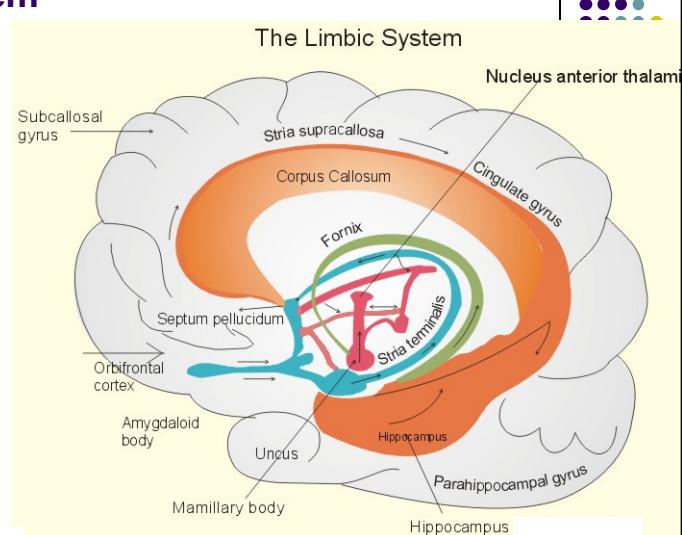

## Functions of Reticular formation

- **The reticular activating system (RAS).**
  - Ascending pathways carrying sensory information to higher centers are channeled through the reticular formation
  - Different degrees of wakefulness depend on the degree of activity of the reticular formation.
- **Consciousness**
  - Pathologic lesions of the reticular formation in humans can result in loss of consciousness
  - loss of consciousness that occurs in epilepsy may be due to inhibition of the activity of the reticular formation
- **Sleep disorders:**
  - **Somnambulism:** sleepwalking
  - **Hypersomnia:** excessive daytime sleepiness
  - **Narcolepsy:** intermittent episodes of uncontrollable sleep.

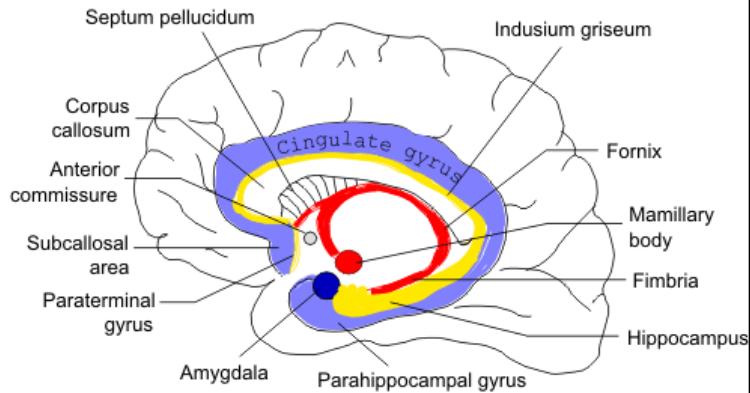

## Limbic system

- Cortical structures
  - Limbic lobe
  - Hippocampal formation
  - Prefrontal cortex
  - Septal areas
- Subcortical structures
  - Hypothalamus
  - Anterior nucleus of thalamus
  - Amygdaloid nucleus
- Connecting pathways
  - Fornix
  - Cingulum
  - Stria terminalis
  - Medial forebrain bundle

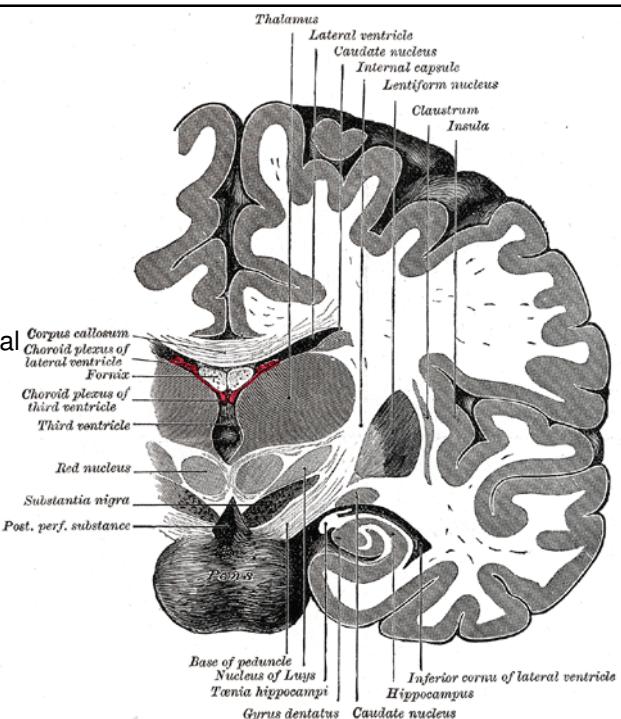

- **Limbic lobe:**  
C shape  
group of  
structures  
seen on the  
medial  
surface of  
the brain  
between the  
cerebral  
cortex and  
diencephalon

## The Limbic System

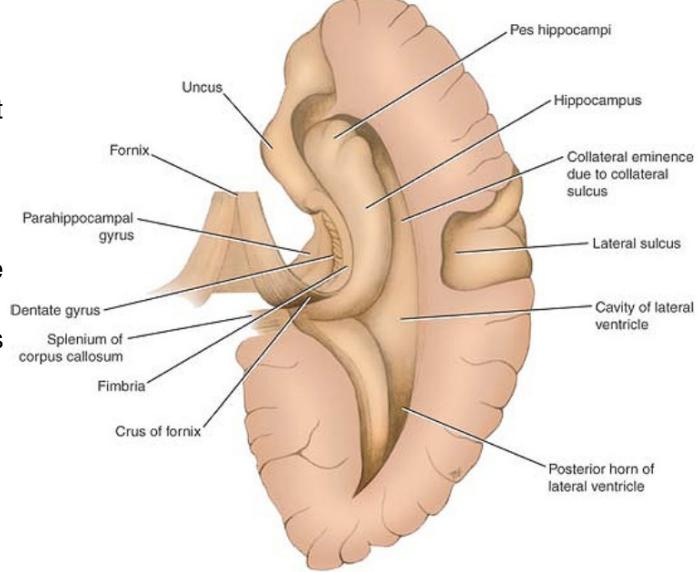

- Components
  - Subcollosal area
  - Isthmus
  - Cingulate gyrus
  - Parahippocampal gyrus
  - Uncus

- The hippocampal formation consists of
  - Hippocampus
  - Dentate gyrus
  - Parahippocampal gyrus

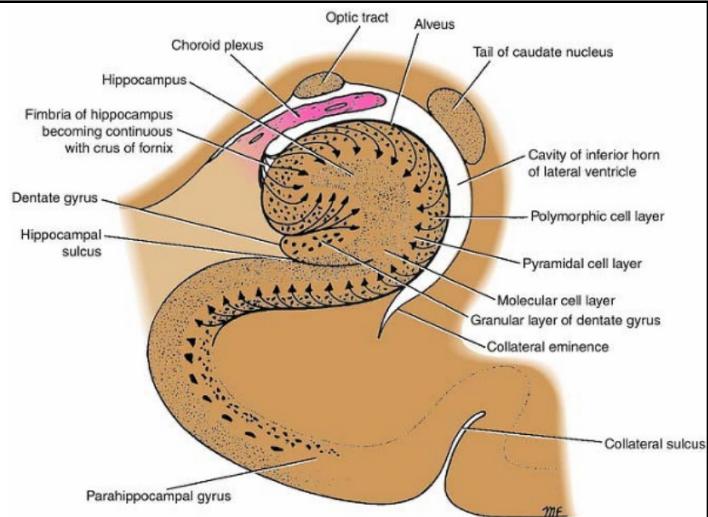

## Hippocampus

- Curved elevation of gray matter that extends throughout the entire length of the floor of the inferior horn of the lateral ventricle
- Anterior end:** pes hippocampi
- Posterior end:** beneath the splenium of the corpus callosum

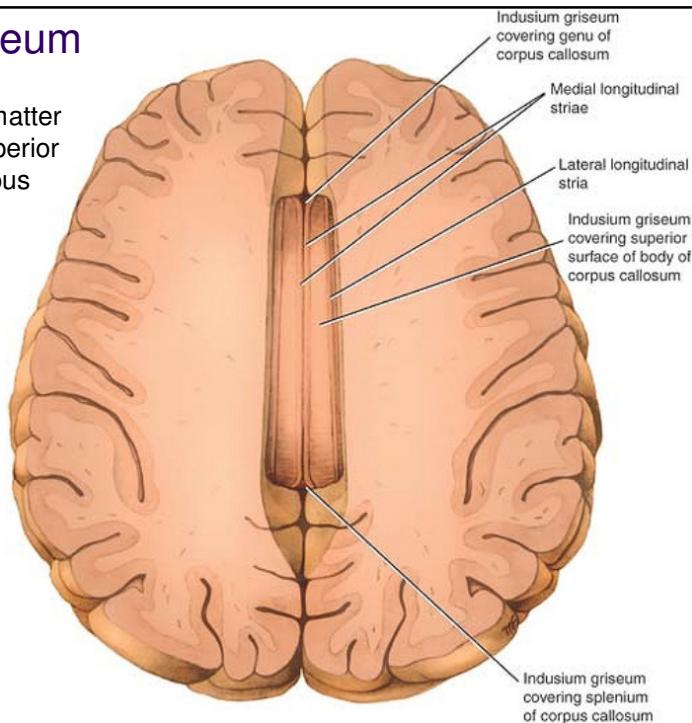

- Alveus:** thin layer of white matter covering the ventricular surface of the hippocampus),
- fimbria**
- Crus of the fornix**
- Dentate gyrus:**
  - narrow, notched band of gray matter that lies between fimbria and parahippocampal gyrus
  - Anteriorly:** continued into the **uncus**
  - Posteriorly:** becomes continuous with the **Indusium griseum**

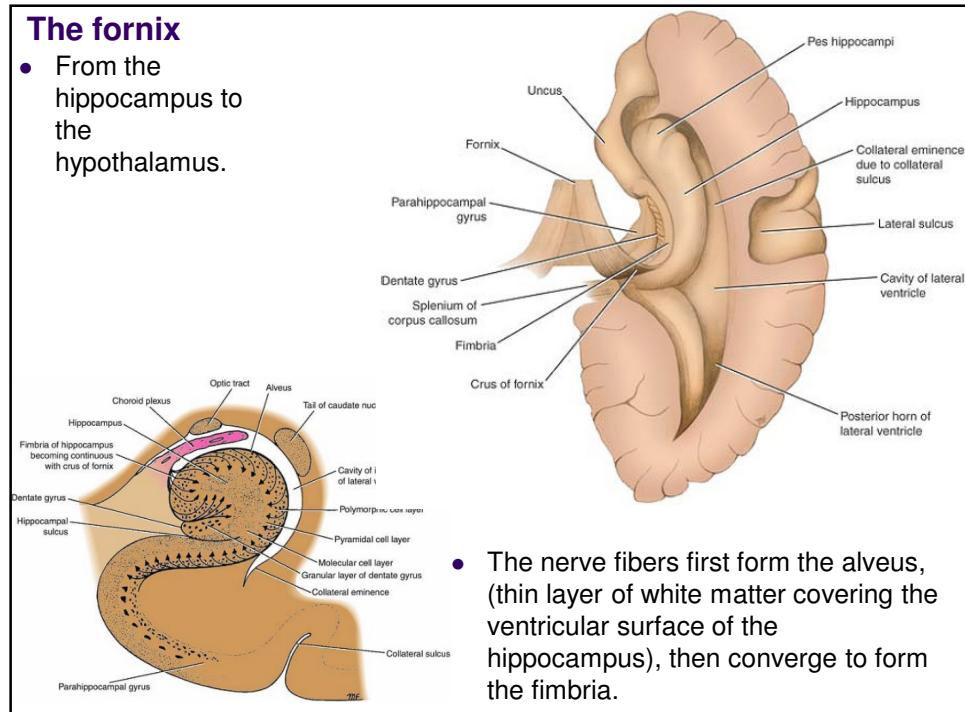

## Indusium griseum

- thin layer of gray matter that covers the superior surface of the corpus callosum

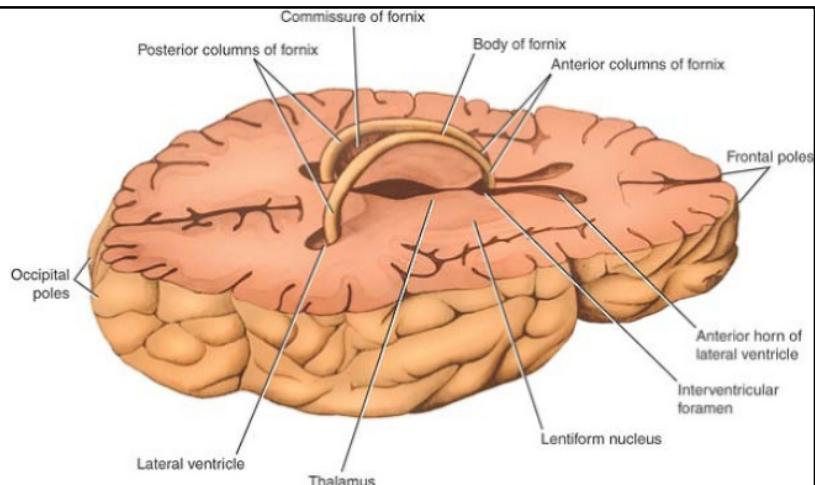

## The fornix

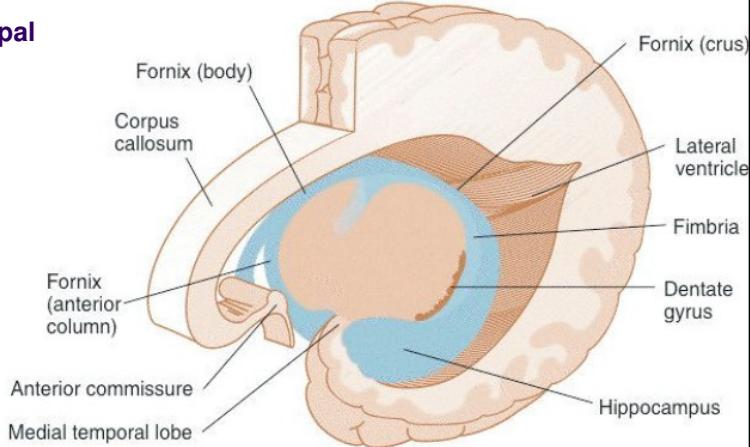

- From the hippocampus to the hypothalamus.

- The nerve fibers first form the alveus, (thin layer of white matter covering the ventricular surface of the hippocampus), then converge to form the fimbria.

**Fornix**

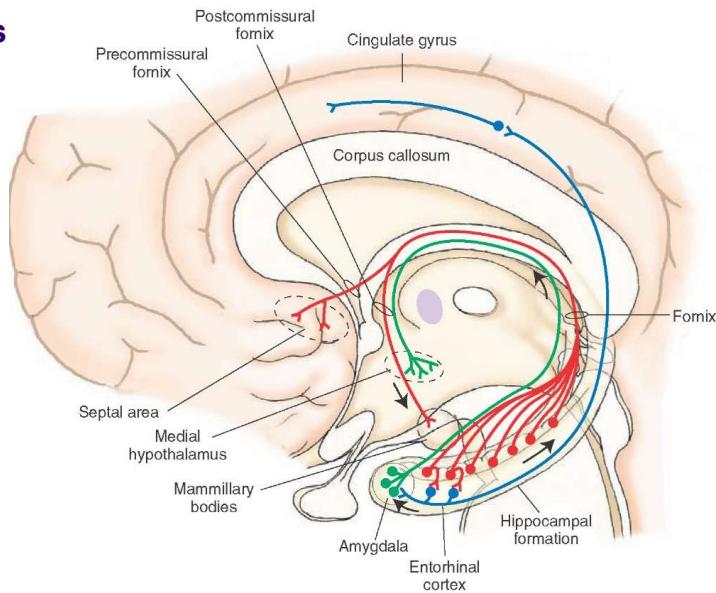

- The fimbriae of the two sides arch forward above the thalamus and below the corpus callosum to form the posterior columns of the fornix.
- The two columns then come together in the midline to form the body of the fornix
- The commissure of the fornix consists of transverse fibers that cross the midline from one column to another just before the formation of the body of the fornix.

**The hippocampal formation**

- Hippocampus
- Dentate gyrus
- Parahippocampal gyrus

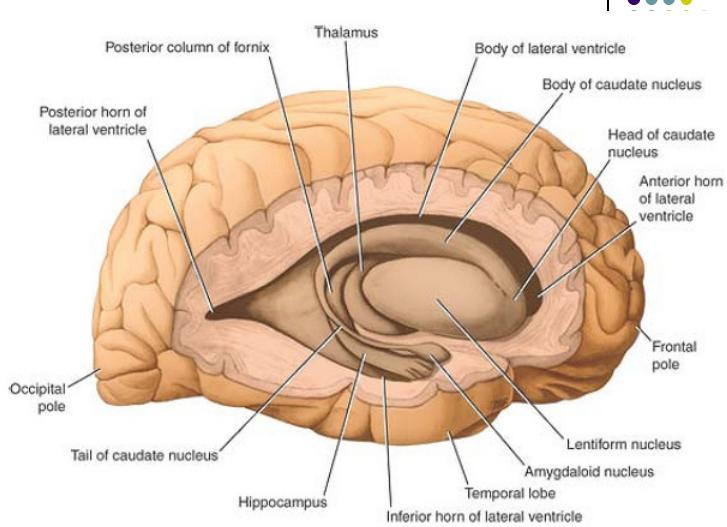

### Septal areas

- Grey matter in the septum pallucidum in front of lamina terminalis
- Connections from the olfactory bulb, hippocampus, hypothalamus, amygdala
- Centre of pleasure

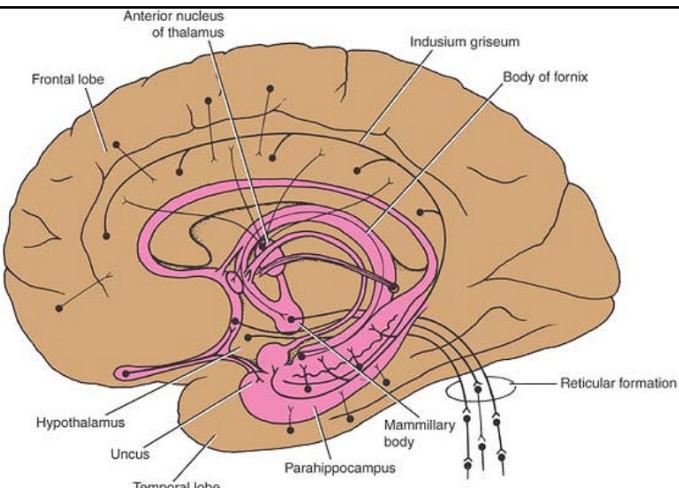

### Amygdaloid nucleus

- Anatomically (basal ganglia)
- Functionally limbic system
- Involved in:
  - Memory
  - Decision making
  - Emotions

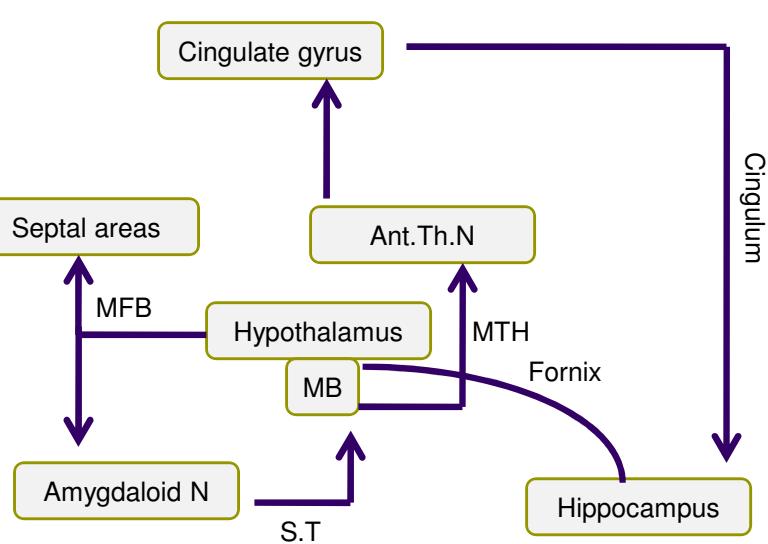

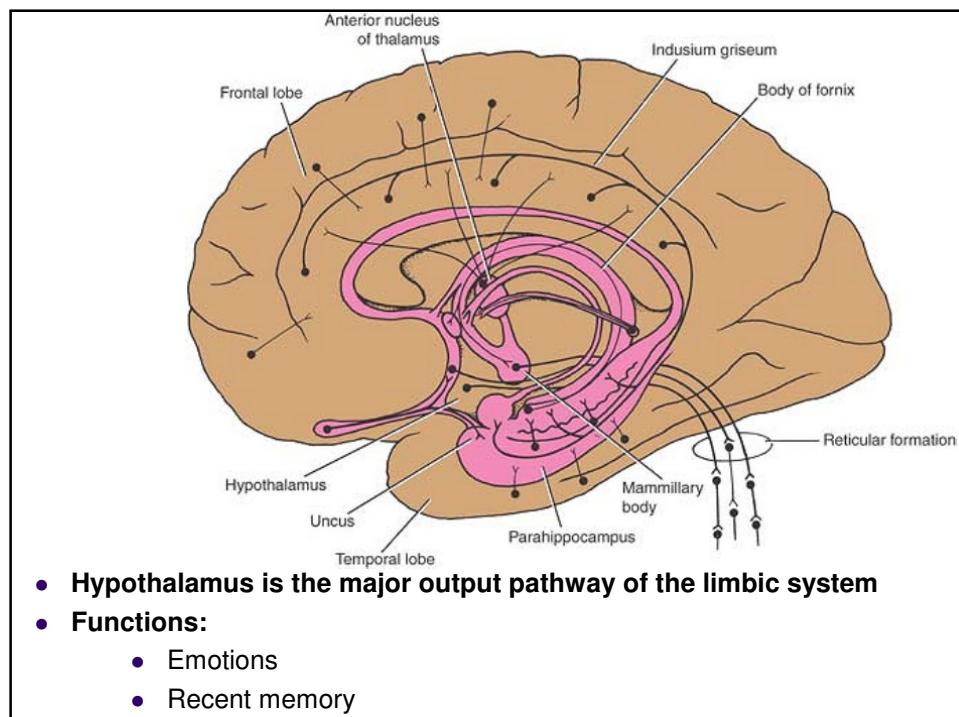

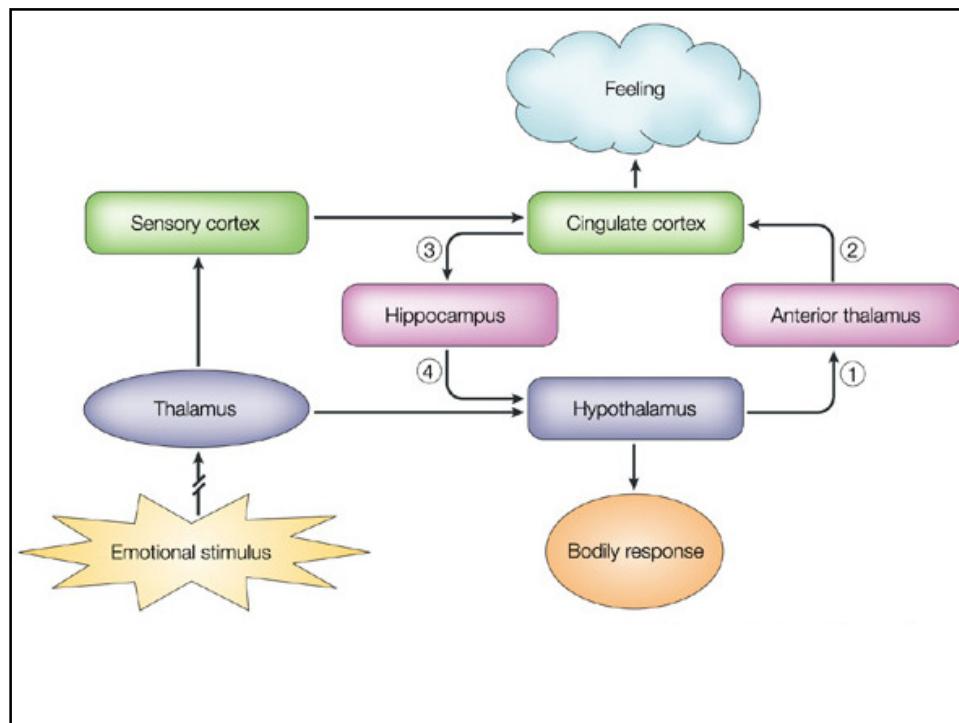

## Connecting pathways

- **Stria terminalis**  
bundle of nerve fibers runs posteriorly in the roof of the inferior horn of the lateral ventricle on the medial side of the tail of the caudate nucleus

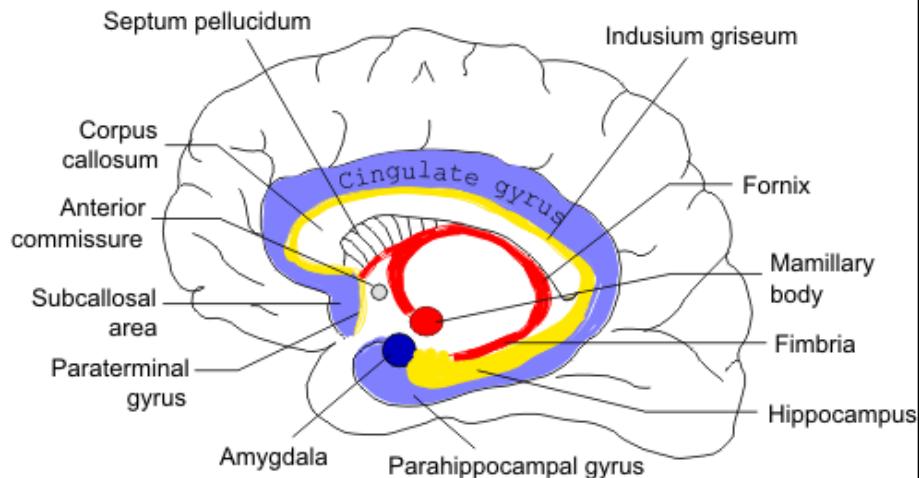

## Papez circuit

## The Limbic System

- 

## Function

- Instinct (Hypothalamus)
- Memory (Hippocampus)
- Emotions (Hippocampus, Amygdala, Prefrontal cortex, septal areas)

## Clinical points

- Lesion of the hippocampus results in (**anterograde amnesia**)
  - The individual is unable to store long-term memory
  - Memory of remote past events before the lesion developed is unaffected
- First area to show damage in Alzheimer disease
- **Kluver-Bucy syndrome:** bilateral removal of amygdala
  - Docility
  - Show no evidence of fear or anger
  - increased sexual activity
  - Hyperphagia
